Karl Heidtbrink

Questions:

1) Selenium allows for testing the web interface that unit testing or mocking cannot accurately test.
It also allows for testing other facts potentially such as network connection or server connection.

2) Selenium only tests the black-box of the website, not the actual underworkings. This can be a problem
when it comes to potential security holes in the website.

3) <tr><td>MyCase</td></tr>

4)
<tr>
     <td>click</td>
     <td>//a[@id='myLink']/</td>
     <td></td>
</tr>

5) HTML is fairly straightforward and easy to understand. A potential drawback is that the programmer is
used to more object oriented or traditional programming approaches rather than a scripting approach.
